BRASHER et al., Detection of Microbial Pathogens in Shellfish with Multiplex PCR., Curr. Microbiol., August 1998, Vol. 37, No. 2, pages 101-107</p> <p>Document 1, which is a non-patent document not mentioned in paragraph 0004 of the description of the present application, which is the prior art of the invention, describes that a new method for simultaneously detecting 18 types of food-originating pathogens using multiplex PCR was developed. Bacteria detected include Escherichia coli O157, salmonella, listeria monocytogenes. This method is mentioned as being described as fast, convenient, comprehensive, and effective.</p> <p>Document 2, which is also a non-patent document not mentioned in paragraph 0004 of the description of the present application, which is the prior art of the invention, describes that a sensitive and rapid method for detecting salmonella, Escherichia coli, and other bacteria which cause food poisoning was developed. In this method, an oligonucleotide primer for five specific genes for each bacterium is used to amplify the five target genes through a single PCR, and it is suggested that this method can be applied to monitoring of pathogens as it is more sensitive and faster than detection using ordinary cultures.</p> <p>In the light of the descriptions in documents 1 and 2, an expert in the technical field could easily conceive of the invention of a multiplex detection method for microorganisms in food described in claims 1-18 of the present application by combining common methods with a DNA extraction process, and the effect thereof would not be anything particular.</p>
